

# THE SCIENCE OF TUMOR BIOLOGY

Highly sensitive profiling of 250+ hot spot mutations

MassARRAY® System

## TARGET. CONFIRM. CAPTURE.

High-throughput somatic mutation profiling for lung cancer research.

Agena Bioscience's LungCarta® Panel v1.0 provides a highly sensitive panel of assays for the evaluation of more than 250 somatic mutations in 26 oncogenes and tumor suppressors for targeted confirmation of genetic events in non-small cell lung tumors. The LungCarta Panel is a compilation of key mutations identified via sequencing discovery studies that affect key pathways in lung adenocarcinoma tumors.<sup>1</sup>

-  Use tumor samples from fresh, frozen, or formalin-fixed paraffin-embedded tissues (FFPE) and/or cell lines.
-  Screen more than 250 mutations in parallel.
-  Detect and quantify mutations with frequencies/abundance as low as 5%.

Assays by Agena also offers panels covering additional oncogenes and somatic mutations. See [www.agenabio.com/oncology](http://www.agenabio.com/oncology) for more information.

## THE MASSARRAY WORKFLOW

Each sample is subjected to PCR amplification and primer extension with the LungCarta Panel v1.0 reagents. The extension products are dispensed onto a SpectroCHIP® Array and detected via MassARRAY MALDI-TOF mass spectrometry. After the sample run, an automated software report provides the calls and mutation frequency for each sample as well as a confidence score.

## THROUGHPUT

The LungCarta Panel v1.0 contains multiplexed assays in 24 wells. The panel can be run in 96-well format (4 samples per plate) or 384-well format (16 samples per plate). Four to 128 samples can be processed per day, providing flexibility in sample throughput and batching requirements.
